Abu Ali ibn Sino nomidagi Buxoro davlat tibbiyot instituti

Mavzuning dolzarbliji. Ko'pgina HCV bilan kasallangan bemorlarga tashxis qo'yilmagan va bir tadqiqotda HCV bilan kasallangan bemorlarning 50 foizi o'zlarining tashxisini bilishmagan [1-4]. Jigar fibrozini baholash uchun ishlatiladigan invaziv bo'limgan testlar orasida vaqtinchalik elastografiya sirozni aniqlash uchun eng aniq usullardan biridir [5-8]. Magnit-rezonans elastografiya ham jigar fibrozini baholashda juda aniq ekanligi isbotlangan, ammo bu test kamroq tarqalgan [9-13]. Sirozni kompyuter tomografiysi (KT), ultratovush yoki magnit-rezonans tomografiya (MRI) kabi rentgenologik tekshiruvlar yoki jigarning igna biopsiyasi orqali aniqlash mumkin [14-19]. Vaqtinchalik yoki magnit-rezonans elastografiyani (MRE) o'z ichiga olgan muayyan ko'rish testlari tavsiya etilishi mumkin[20-26]. Ushbu invaziv bo'limgan ko'rish testlari jigarning qattiqlashishi yoki qotib qolishini ko'rib chiqadi[27-32].

Material va metodlar. Jigar funksiyasi testlari odatda: RNK testi (ribonuklein kislotasi) bo'lib, u qonda virusning genetik materiali mavjudligini tekshiradi.

alanin transaminaza (ALT), aspartat transaminaza (ACT) Gamma-glutamil transpeptidaza (GGT) testi.

Tekshirish natijalari. 2022 yildan 2024 yilgacha hujjatlashtirilgan HCV bilan kasallangan va antiviral terapiya uchun rejalashtirilgan 40 bemor ushbu istiqbolli, kuzatuv tadqiqotiga kiritilgan. Bemorlar tibbiy sog'liqni saqlash markazining ambulatori sifatida yaratilgan. Yuqorida davrda HCV bilan davolangan qariyb 50 nafar bemordan 20 nafari faqat ishtirok etishga qiziqish bildirgan. Ushbu tadqiqotda ishtirok etgan barcha bemorlarni tanlash mezonlari HCV uchun ijobjiy antikorlar va kamida 6 oy davomida tekshirilishi mumkin bo'lgan virus miqdori surunkali faol infeksiyaga dalil sifatida ko'rsatilgan. Bemorlar haqiqiy yoki ilgari antiviral HCV terapiyasidan mustaqil ravishda kiritilgan. Barcha bemorlar uchun HCV genotiplari

sinovdan o'tkazildi. Institutsional tekshiruv kengashi tadqiqotni ma'qulladi va bemorlarga o'rganish tartibi haqida ma'lumot berildi.

Xulosa. Jigar fibrozini baholash bemorlarni tabaqalashtirish va boshqaruv va kuzatuvni rejalashtirish uchun muhim ahamiyatga ega. Jigar biopsiyasi va gistologik baholash o'ziga xos chekllov larga qaramay, fibrozni aniqlashda oltin standart bo'lib qolmoqda. Siroz - bu jigar ichidagi shikastlanishga sezilarli darajada saqlanib qolgan javobning patogen oqibati bo'lib, to'qimalarda progressiv fibrozning cho'kishi va jigarning normal tuzilishining buzilishi bilan tavsiflanadi. Tasdiqlovchi test ko'pincha RNK testi (ribonuklein kislotasi) bo'lib, u qonda virusning genetik materiali mavjudligini tekshiradi.
